1. Isolation of single neurons
Postmortem human brain
Dissection
CA1 or subiculum
Tissue smears
Immunocytochemistry
Isolating cells
2. aRNA amplification
Reverse transcription with T7-oligo(dT) primer
PCR with primers for GAPDH
2nd strand cDNA synthesis
aRNA amplification
3. Analysis of the differences
Dot-blot hybridization

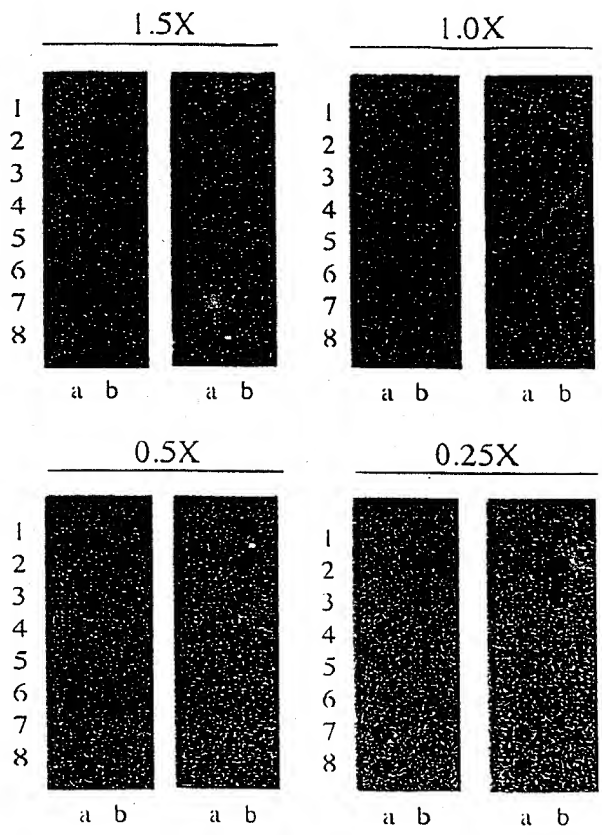

Fig. 4. Dot blot hybridization of aRNA from one cell with selected cDNAs. The aRNA was used at four concentrations, 1.5 ×, 1.0 ×, 0.5 × and 0.25 ×. For each concentration, hybridization was done in duplicate. On each blot: column a, from rows 1–8, the cDNAs are HSP70, p53, HII, nestin, actin, STM2, cyclin D1 and CamK II; column b, rows 1–5 S182, α1-ACT, GAPDH, GFAP and pBS.
